

Damage Stability of Cruise Ships

Henning Luhmann
12/04/2016

MEYER WERFT
PAPENBURG 1795

History of SOLAS requirements

MEYER WERFT

2

- SOLAS 74
 - 2-compartment standard, margin line and floodable length
 - A265 equivalent probabilistic method
- SOLAS 90
 - 2-compartment standard, GZ requirements
- SOLAS 92
 - Probabilistic damage stability for cargo ships
- SOLAS 2009
 - Harmonized damage stability
 - Different required index for cargo and passenger ships
 - Same safety standard as SOLAS90
- SOLAS2020
 - New required index

Reasons for revision

MEYER WERFT

3

- Concerns raised
 - Does SOLAS2009 have the same safety standard as SOLAS90?
 - How to deal with „water-on-deck“?
 - Do we need to raise safety after flooding?
- Research projects
 - EMSA1, Safedor, EMSA2, GOALDS, EMSA3
 - National projects in UK, Denmark, Sweden, Germany
- Accident COSTA CONCORDIA
- Inconsistencies in SOLAS2009

→ Decision to revise safety standard

→ Revision of SOLAS II-1

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Reg.6 Required Index

MEYER WERFT

4

- Basis for new R index based on EMSA3 results
- Various proposals have been discussed
- Difficult to agree for small ships due to wide variety of ship types and designs

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Reg.6 Required Index SCD3

MEYER WERFT

5

- SDC3 decision → political compromise
 - Only parameter: N = number of persons

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Reg.6 Required Index

MEYER WERFT

6

- Huge reduction of risk
 - 200 POB → -25% risk
 - 1000 POB → -40% risk
 - 7000 POB → -30% risk

- Previous political decision taken at MSC82 corrected
- Safety level of small ships significant increased

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Reg.7-2 s-factor

MEYER WERFT

7

- Special requirement for RoPax

- Influence of “water-on-deck” accounted in new s-factor
- GZ properties based on model tests with conventional ships
- RoPax require higher GZ and Range to survive

- GZ: 0.12m → 0.2m
- Range: 16 deg → 20 deg

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Other changes

MEYER WERFT

8

- No WTD to be kept open during navigation
 - Significant design change for smaller ships
- Principle of Entry into Force changed
 - Keel laying is not relevant anymore
 - 3 dates principle as in MARPOL
 - Entry into force:
 - **Contract** on/after **1.1.2020**
 - If no contract: Keel laying on/after [1.1.2020]
 - **Delivery** not later than [**1.1.2024**]

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Design Consequences RoPax

MEYER WERFT 9

- Safety level most likely higher than 2003/25/EC
- Effect of new s-factor depending on ship design
 - For larger ships 2-6% loss of attained index
 - For smaller ships up to 10% loss on attained index
- For some designs and routes significant changes likely
 - In particular for ships with less 400 POB
 - Maybe no suitable LLH possible
 - Difficult to meet EEDI requirements
 - Modal change to road traffic or pure RoRo ships possible
- Many RoPax are engaged under domestic / EU trade
 - Development of new EC directive uncertain
- Difference between new ships and existing ships is increased, many old ships remain in service with old safety standard

Stockholm Agreement

SOLAS 2009

New S-factor

New R index

SOLAS 2020

Henning Luhmann EMSA / SeaEurope Workshop 12/04/2016

Design Consequences Cruise ships

MEYER WERFT 10

- Small cruise ships facing severe problems
 - One compartment standard not possible anymore for ships with <400 POB
 - New R level will be determining criterion
 - Higher freeboard and larger breadth required to meet R
 - no passenger below bulkhead deck suitable due to WTD restrictions

→ significant increase of ship size in particular for ships with less than 400 POB

Henning Luhmann EMSA / SeaEurope Workshop 12/04/2016

Design Consequences Cruise ships

MEYER WERFT

11

- Large cruise ships
 - approx 5-6% less capacity due to higher freeboard and breadth or changed subdivision
 - increase of life-cycle costs and ticket prices
 - No significant influence on design concepts
- Cruise industry supports increase of safety level
- Application scheme may require significant design changes within ship series
 - Delivery 1.1.2024
 - Slots of European shipyards already booked until 2023
- New requirements may already been applied in new projects now

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

More Research Needed

MEYER WERFT

12

- Safety level as indicated by SOLAS is significantly different to real case experiences and numerical simulations
- e.g. Costa Concordia stayed afloat for many hours, even though she was built to SOLAS90 standard
- Survivability indicated by simulations is >95%

→ joint industry project under preparation by CSSF

eSAFE enhanced Survivability After Flooding Event

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Difference RoPax vs Cruise

MEYER WERFT

13

- Damage Stability Regulations are largely based on model tests on RoPax
- Model tests for cruise are complicated and expensive, but:
- Huge difference between RoPax and cruise
 - Different risks and accident frequencies
 - Different sinking behavior (rapid capsize vs slow sinking) due to different internal subdivision
 - Research during the last 20 years focused on RoPax → applicability of s-factor for cruise ships remains questionable
- But:
 - **One level of R defined for all passenger ships**

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Simplification of SOLAS

MEYER WERFT

14

- A number of simplifications are included in SOLAS
 - Grounding not included in attained index
 - Distribution of draughts not realistic
 - Probability of sea state not considered
 - Aspects of evacuation mixed with survivability after flooding
- Complex subdivision not covered by actual s-factor
- Impact of various aspects to be quantified
- Preparation to apply first-principle methods
- Methodology to use numerical simulations

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Sample ships

MEYER WERFT

15

- Sample ships are As-built ships, no projects
 - Real design environment is used
 - Detailed design information available
 - Onboard data available
- Whole range of CLIA fleet to be considered
- Cover a wide range of size and operational area

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Initial conditions and environment

MEYER WERFT

16

- Collection of onboard data for 1 month of at least 10 different ships operated by CLIA members
- Weighing factors for DL, DP and DS to be checked
 - $A = 0.2 * A_{DL} + 0.4 * A_{DP} + 0.4 * A_{DS}$

- Calculation of A Index using real loading conditions, including tank fillings
 - Significant impact due to
 - Actual tank fillings
 - Behaviour of free surfaces
 - Actual GM

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Effect of wave heights

MEYER WERFT

17

- SOLAS s-factor is based on probability to survive flooding accident up to 4m wave height
- 4 m wave height based on old damage statistics (Stab15, HARDER)

Table 3.4 Scatter diagram for the World Wide trade.

$T_z(s)$	3.5	4.5	5.5	6.5	7.5	8.5	9.5	10.5	11.0
$H_s(m)$	1.2	1.5	1.8	2.1	2.4	2.7	3.0	3.3	3.6
1	2711	1202	470	168					
2	6020	3000	1225	431					
3	4973	3004	1377	511					
4	2881	2156	1154	481					
5	1338	1230	776	371					
6	540	597	440	241					

- Probability of sea state not included
 - 90% are less than 3m, 60% are less than 2m
- Ship size may have significant influence
- More damage cases are survived in smaller waves

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Effect of SOLAS parameters

MEYER WERFT

18

- Influence of other parameters on attained index A to be verified
 - Immersion of escape routes and emergency stations
 - K-factor using 7 and 15 degrees as heel limits
 - External moments
 - Permeabilities may be wrong
- Calculation methods to be reviewed for handling of openings
 - Downflooding points not considered to stop GZ curve but calculation including progressive flooding through the opening

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Non-zonal Approach for collision

MEYER WERFT

19

- Develop a non-zonal approach for collision damages
- Geometrical and probabilistic model of collision damage in accordance with SOLAS2009 to generate hull breaches
- Probabilistic description of lower limit of damage is missing in SOLAS2009 (presently worst case for s-factor): update needed
- Reference data from GOALDS
- Continue work from EMSA3

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Combined collision and grounding

MEYER WERFT

20

- Survivability assessment considering "all" types of damages
- Source of breach not relevant
 - Collision
 - Bottom grounding
 - Side grounding
- Determination of relative frequencies of different type of accidents (analysis of EMSA3 database)
- consider risk models developed in EMSA3 as a basis for the combination

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Derivation of s-factor

MEYER WERFT

21

- Current s-factor based on RoPax modeltests
- Special behaviour of cruise ships to be considered
- Flow of water is randomly process
- Use the results from the simulations, confirmed by validation to propose a modified s-factor appropriate for the cruise ship design
- Based on work done in GOALDS
- No model tests, but numerical simulations

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Numerical simulations

MEYER WERFT

22

- Enhance numerical simulations as an alternative method for assessment of survivability
- Guideline to be developed to approve software and results
- Common guidance how to deal with probabilities, sea states, initial conditions
- Strategy to be developed to consider escape routes, external moments, max heel for LSA etc
- Comparison with updated static calculations

Henning Luhmann

EMSA / SeaEurope Workshop

12/04/2016

Conclusion

MEYER WERFT

23

- **New SOLAS2020 increase the safety level significantly**
- **Combination of new requirements may change some ship designs**
- **Some routes may suffer from modal change**
- **Gap between existing ships and new design will increase**
 - **Delay of introduction of improved safety level**
 - **Economic advantage of old ships**
- **Difference between RoPax and cruise ships to be further studied**
- **Quantification of real safety level for cruise ships needed**
